

Range Minimum Queries and Lowest Common Ancestor

Inge Li Gørtz

Range Minimum Queries and Lowest Common Ancestor

- Range Minimum Queries (RMQ) and Lowest Common Ancestor (LCA)
- RMQ
 - Simple solutions
 - Better solution
 - 2-level solution
- Reduction between RMQ and LCA

Range Minimum Queries

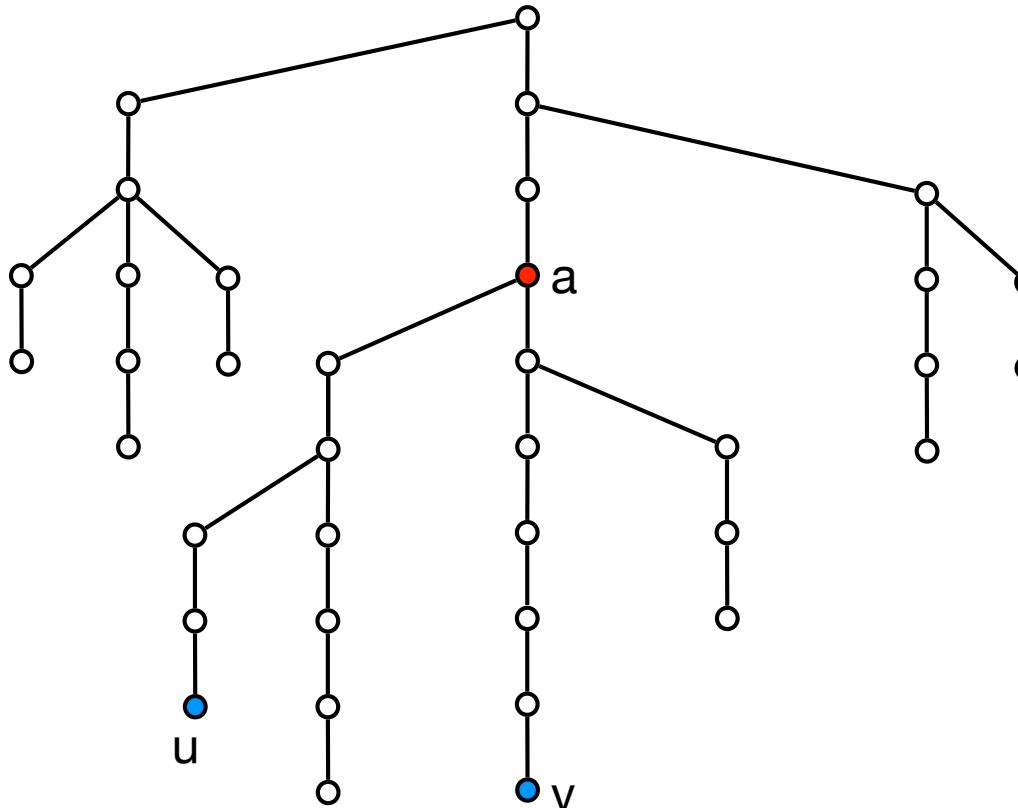

- **Range minimum query problem.** Preprocess array $A[1\dots n]$ of integers to support
 - $\text{RMQ}(i,j)$: return the (entry of) minimum element in $A[i\dots j]$.

1	2	3	4	5	6	7	8	9	10
1	7	12	8	2	5	1	4	8	3

- $\text{RMQ}(3,6) = 2$ (index 5)
- Basic (extreme) solutions
 - **Linear search:**
 - Space: $O(n)$. Only keep array (no extra space)
 - Time: $O(j-i) = O(n)$
 - **Save all possible answers:** Precompute and save all answers in a table.
 - Space: $O(n^2)$ pairs $\Rightarrow O(n^2)$ space
 - Time: $O(1)$

Lowest Common Ancestor

- Lowest common ancestor problem. Preprocess rooted tree T with n nodes to support
 - $\text{LCA}(u,v)$: return the lowest common ancestor of u and v.

$$\text{LCA}(u,v) = a$$

Lowest Common Ancestor

- Basic (extreme) solutions
 - **Linear search**: Follow paths to root and mark when you visit a node.
 - Space: $O(n)$. Only keep tree (no extra space)
 - Time: $O(\text{depth of tree}) = O(n)$
 - **Save all possible answers**: Precompute and save all answers in a table.
 - Space: $O(n^2)$ pairs $\Rightarrow O(n^2)$ space
 - Time: $O(1)$

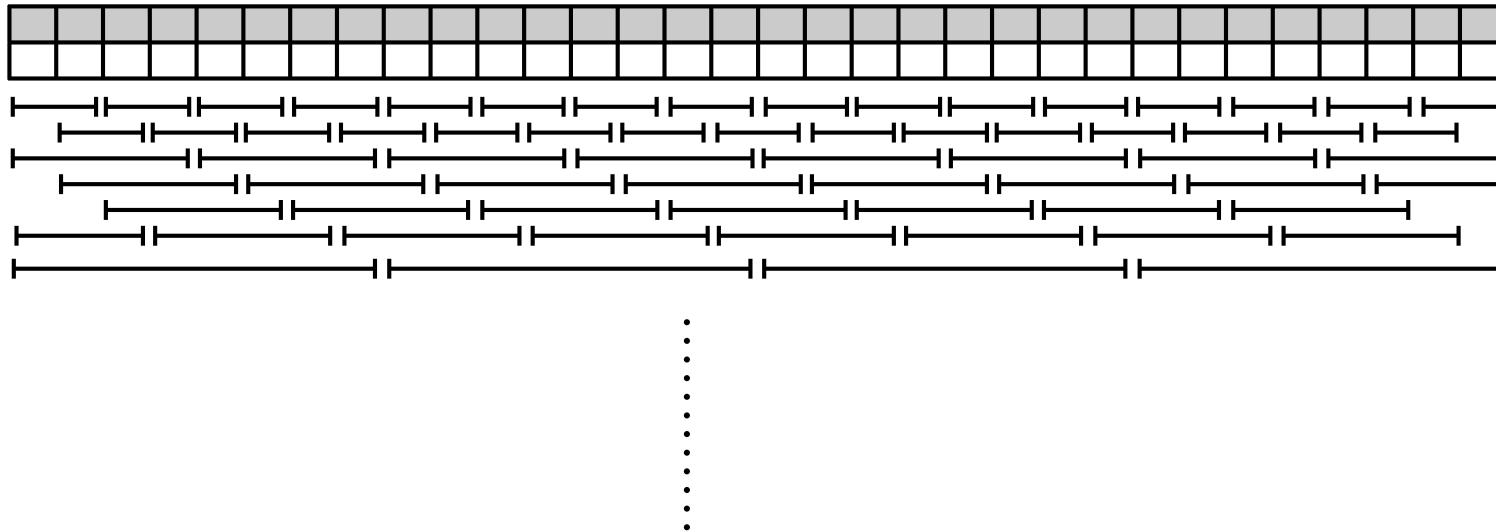

RMQ and LCA

- [Outline.](#)
 - Can solve both RMQ and LCA in linear space and constant time.
 - First solution to RMQ
 - Solution to a special case of RMQ.
 - See that RMQ and LCA are equivalent (can reduce one to the other both ways).

RMQ

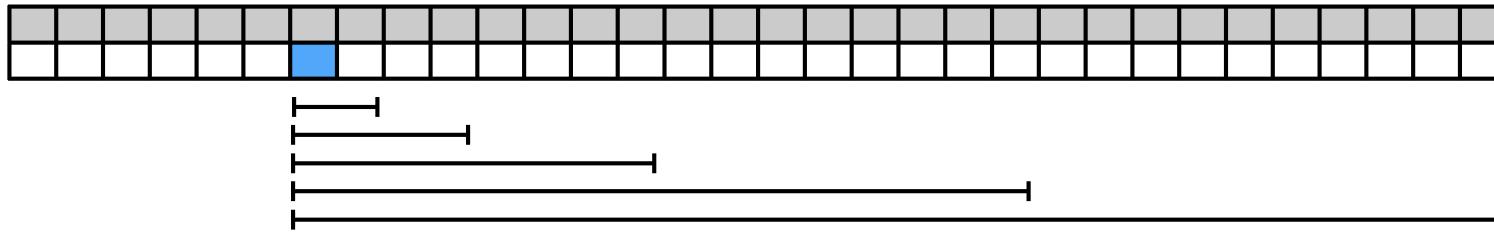

RMQ: Sparse table solution

- Save the result for all intervals of length a power of 2.

RMQ: Sparse table solution

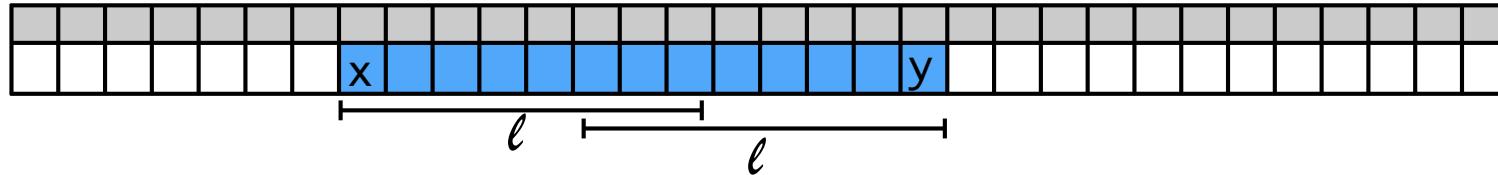

- For all positions we have all power of 2 length intervals starting at that position.

- Space: $O(n \log n)$

RMQ: Sparse table solution

- Query:

- Any interval the union of two power of 2 intervals.
- Query the two intervals and take minimum
- Time: O(1)

RMQ: Linear space

- Consider ± 1 RMQ: consecutive entries differ by at most 1.

1	2	3	4	5	6	7	8	9	10	11	12	13
4	5	6	5	4	3	2	3	2	3	4	5	4

- 2-level solution: Combine

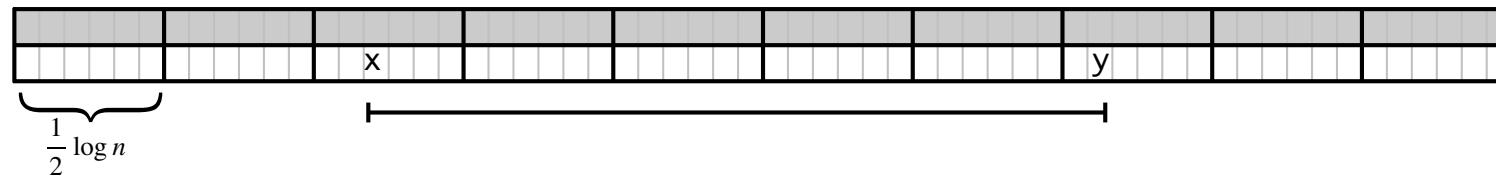

- $O(n \log n)$ space, $O(1)$ time
- $O(n^2)$ space, $O(1)$ time.

↓

- $O(n)$ space, $O(1)$ time.

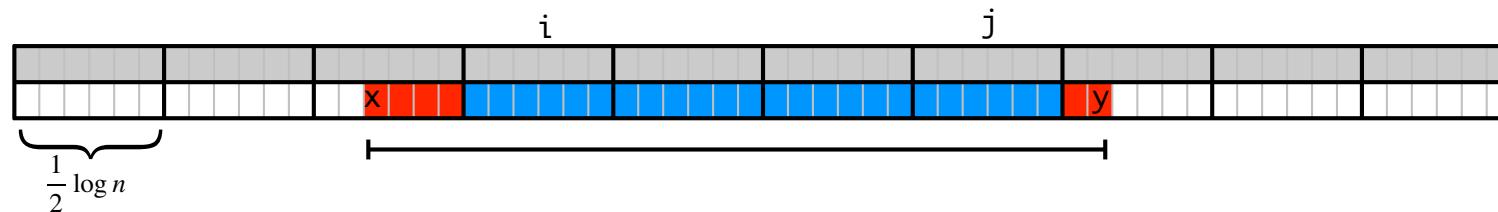

± 1 RMQ

- Divide A into blocks of size $\frac{1}{2} \log n$

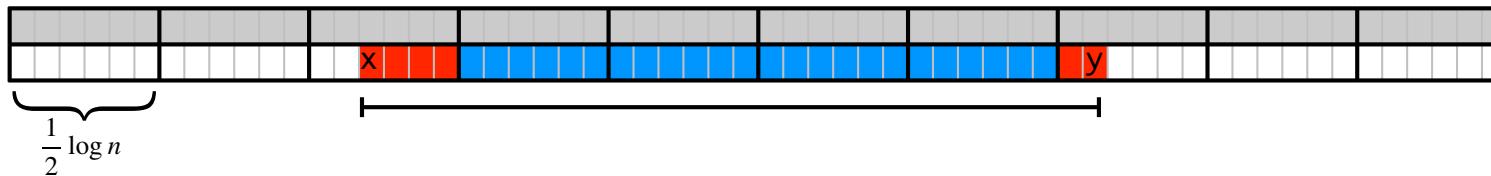

± 1 RMQ

- Divide A into blocks of size $\frac{1}{2} \log n$

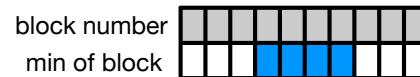

- 2-level data structure:
 - Sparse table on blocks
 - Tabulation inside blocks.
- $\text{RMQ}(x,y) = \min\{ \text{RMQ on blocks } i \text{ to } j, \text{RMQ inside block } i-1, \text{RMQ inside block } j+1 \}$.

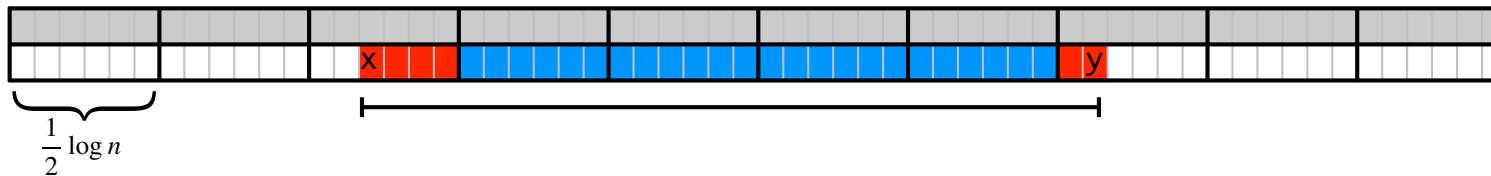

± 1 RMQ: Data structure on blocks

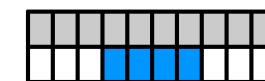

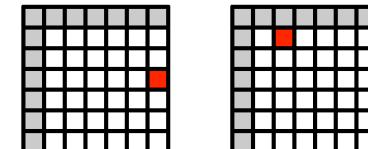

- Two new arrays.
 - Array A' : minimum from each block
 - B : position in A where $A'[i]$ occurs.
- Sparse table data structure on A' .
- Space: $O(|A'| \log |A'|) = O(n)$.
- Time: $O(1)$

± 1 RMQ: Data structure inside blocks

- Precompute and save all answers for each block.
- Gives solution using
 - Space: $O(n)$ + space for precomputed tables.
 - Time: $O(1) + O(1) + O(1) = O(1)$.

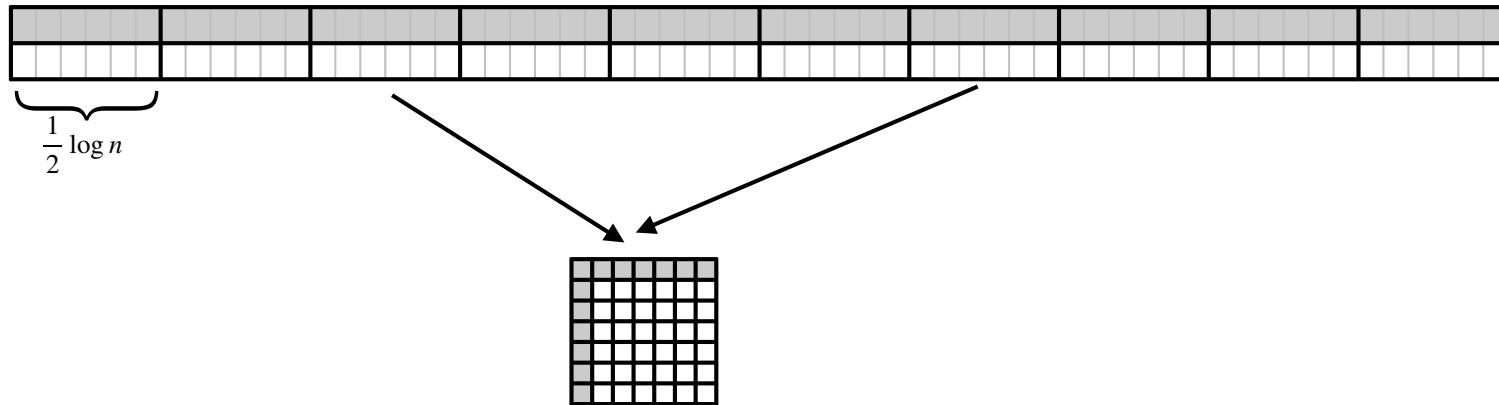

↑ ↑ ↑
2 table sparse $\min\{\cdot, \cdot, \cdot\}$
lookups table

± 1 RMQ: Storing the tables

- Naively: $\log^2 n$ for each table => $n \log n$ space. 😞
- **Observation:** If $X[i] = Y[i] + c$ then all RMQ answers are the same for X and Y.
 - $X = [7, 6, 5, 6, 5, 4]$
 - $Y = [3, 2, 1, 2, 1, 0]$
- **Normalize** blocks:
 - $X = [0, -1, -2, -1, -2, -3] = Y$
 - Normalized block described by sequence of +1s and -1s:
 - $X = Y = -1, -1, +1, -1, -1.$
 - How many different normalized blocks are there?
 - length of sequence = $\frac{1}{2} \log n - 1$
 - #sequences = $2^{\frac{1}{2} \log n - 1} \leq \sqrt{n}$.

± 1 RMQ: Data structure inside blocks

- Precompute and save all answers for each normalized block.
- Size of a table: $O(\log^2 n)$
- For each block save which precomputed table it uses.

- Space: $O(\sqrt{n} \cdot \log^2 n) + O(n/\log n) = O(n)$
- Plugging into 2-level solution:
 - Space: $O(n) + \text{space for precomputed tables} = O(n)$.

LCA and RMQ

RMQ and LCA

- We will show

$$\text{RMQ} \xrightarrow{\text{reduces to}} \text{LCA} \xrightarrow{\text{reduces to}} \pm 1\text{RMQ}$$

If there is a solution to LCA using $s(n)$ space and $t(n)$ time, then there is a solution to RMQ using $O(s(n))$ space and $O(t(n))$ time.

If there is a solution to $\pm 1\text{RMQ}$ using $s(n)$ space and $t(n)$ time, then there is a solution to LCA using $O(s(n))$ space and $O(t(n))$ time.

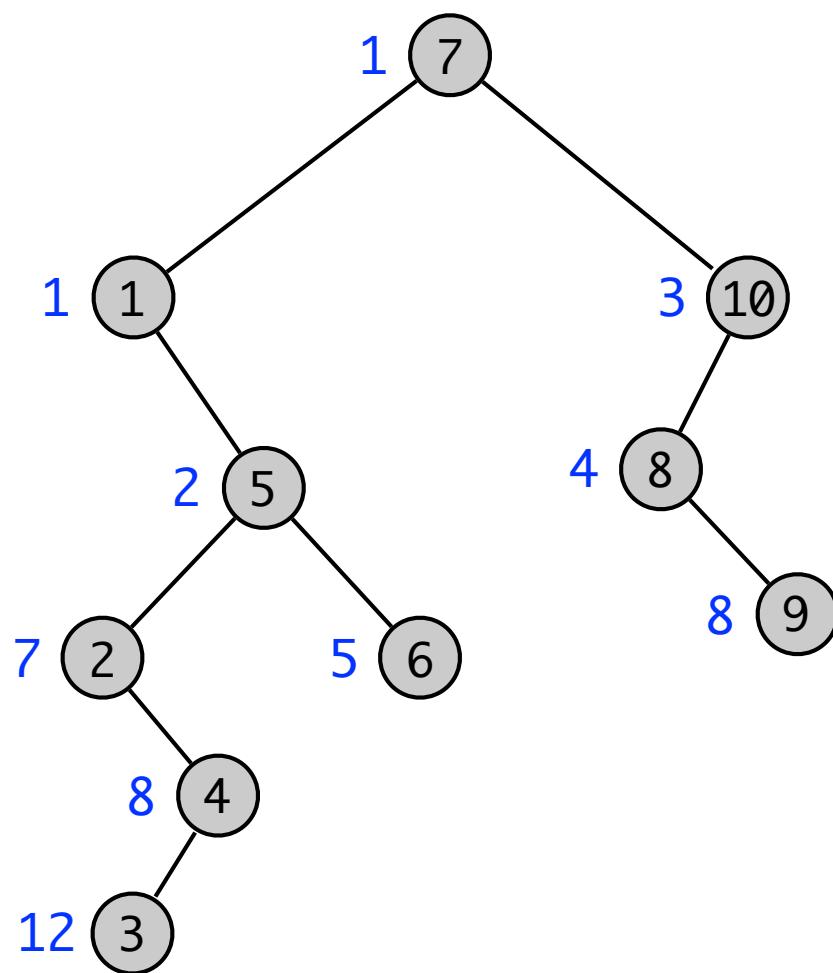

RMQ to LCA

1	2	3	4	5	6	7	8	9	10
1	7	12	8	2	5	1	4	8	3

Blue horizontal bars indicate ranges for RMQ queries:

- Range [1, 5] (length 5)
- Range [2, 4] (length 3)
- Range [5, 8] (length 4)
- Range [7, 10] (length 4)

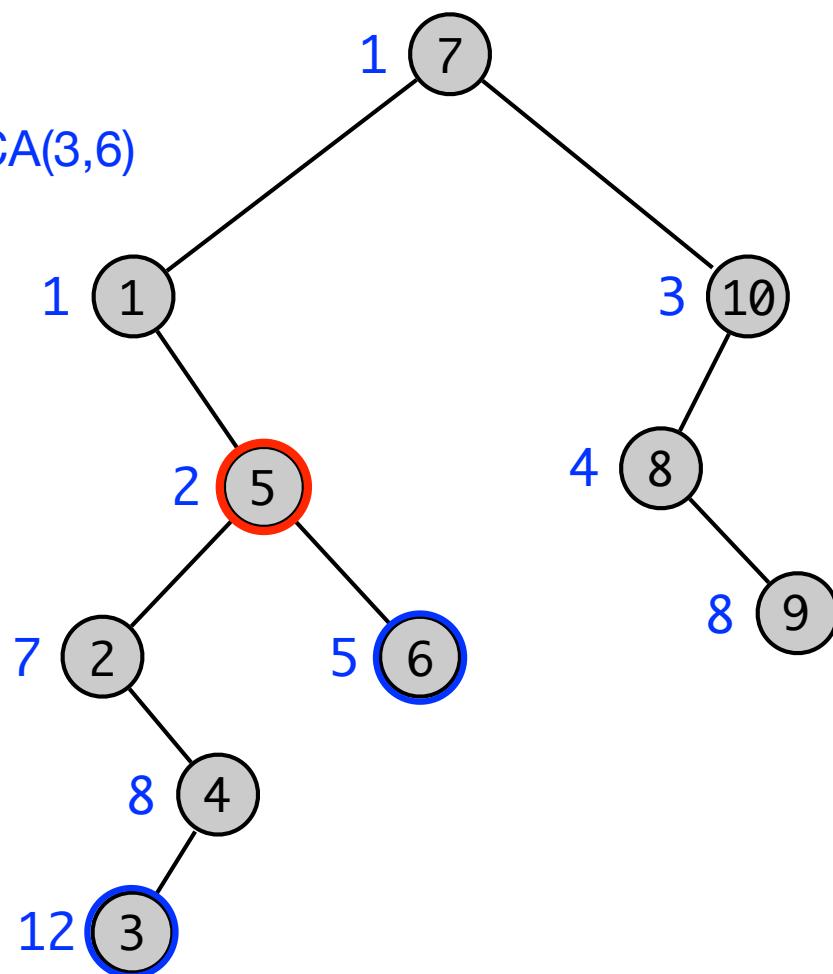

- Cartesian tree.

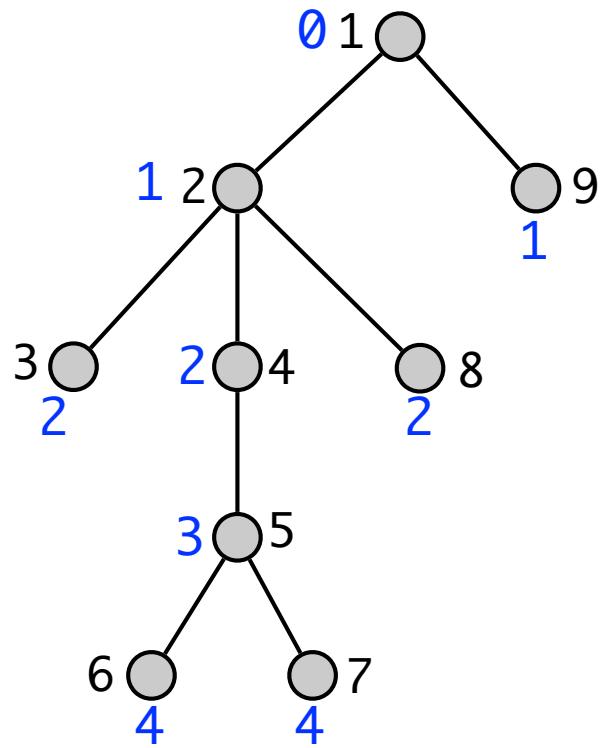

RMQ to LCA

1	2	3	4	5	6	7	8	9	10
1	7	12	8	2	5	1	4	8	3

- Cartesian tree.
- $\text{RMQ}(3,6) = \text{LCA}(3,6)$

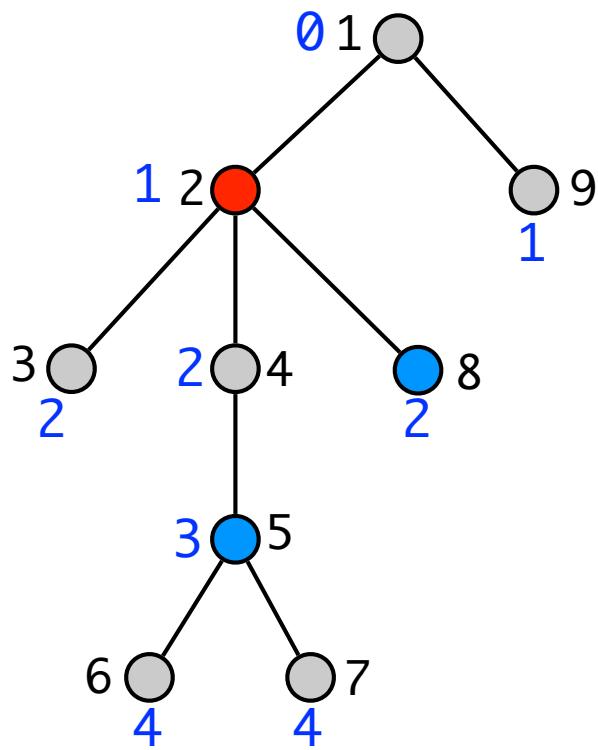

LCA to ± 1 RMQ

- $E = \begin{array}{|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|} \hline 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 & 16 & 17 \\ \hline 1 & 2 & 3 & 2 & 4 & 5 & 6 & 5 & 7 & 5 & 4 & 2 & 8 & 2 & 1 & 9 & 1 \\ \hline \end{array}$
- $A = \begin{array}{|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|} \hline 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 & 16 & 17 \\ \hline 0 & 1 & 2 & 1 & 2 & 3 & 4 & 3 & 4 & 3 & 2 & 1 & 2 & 1 & 0 & 1 & 0 \\ \hline \end{array}$
- $R = \begin{array}{|c|c|c|c|c|c|c|c|c|} \hline 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 \\ \hline 1 & 2 & 3 & 5 & 6 & 7 & 9 & 13 & 16 \\ \hline \end{array}$

- **E: Euler tour representation:** preorder walk, write node preorder number of node when met.
- **A:** depth of node node in $E[i]$.
- **R:** first occurrence in E of node with preorder number i
- **LCA(i, j)** = $E[\text{RMQ}_A(R[i], R[j])]$.

LCA to ± 1 RMQ

- $\text{LCA}(5,8) = \text{RMQ}_A(6, 13)$.

- $E = \begin{array}{|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|} \hline 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 & 16 & 17 \\ \hline 1 & 2 & 3 & 2 & 4 & 5 & 6 & 5 & 7 & 5 & 4 & 2 & 8 & 2 & 1 & 9 & 1 \\ \hline \end{array}$

- $A = \begin{array}{|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|} \hline 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 & 16 & 17 \\ \hline 0 & 1 & 2 & 1 & 2 & 3 & 4 & 3 & 4 & 3 & 2 & 1 & 2 & 1 & 0 & 1 & 0 \\ \hline \end{array}$

- $R = \begin{array}{|c|c|c|c|c|c|c|c|c|} \hline 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 \\ \hline 1 & 2 & 3 & 5 & 6 & 7 & 9 & 13 & 16 \\ \hline \end{array}$

- **E: Euler tour representation:** preorder walk, write node preorder number of node when met.
- **A:** depth of node node in $E[i]$.
- **R:** first occurrence in E of node with preorder number i
- $\text{LCA}(i, j) = E[\text{RMQ}_A(R[i], R[j])]$.

RMQ and LCA

- **Theorem.** RMQ and LCA can be solved in $O(n)$ space and $O(1)$ query time.
